

Forklift Fork Positioners

Fork Positioner for Forklifts - A fork positioner is actually a device constructed out of top quality materials intended to be able to endure the most demanding operations and work environments. This particular piece of equipment could enable the person driving to operate the blades hydraulically without leaving the seat. Side shifting models have the extra ability to be able to laterally position the entire load or the arms so as to facilitate more accurate lifting and position in a faster and much more effective manner.

The fork pocket is rather unique and can enable the one operating it to securely swing the forks into position without any fear of damaging the positioning cylinders. This can allow the driver the choice to perform independent or simultaneous fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into fork positioners on existing units.
